

PA - 2347

On Recombination on the Occasion of a Collision of Current Carriers in Semiconductors.

The electrons in the conductivity zone can also be produced by illumination of the crystal. If the wave functions for the initial state are considered as plane waves and for the final state of the bound electron as spherically symmetric functions (which are limited to a domain with the radius R), the expression $(1/) = C m^{3/2} e^{-E/2} R^3 P^2 / h^3$ is obtained for the probability of recombination. Here the constant C depends on the number of holes which are able to recombine with the given center. In view of the inaccuracy of evaluation, agreement with the experiment is good. According to the author's opinion the ideas discussed are a convincing argument in favor of the fact that collision recombination may in various cases be the predominant mechanism. This phenomenon apparently plays an important part in the physics of semiconductors. (No illustrations).

 ✓ Electronic processes at grain boundaries. L. Sosnowski
 (Inst. Phys., Warsaw). *Phys. and Chem. Solids* 8, 142-6
 (1958).—The elec. properties of grain boundaries of several
 kinds, such as the low-angle boundary and the coherent and
 incoherent twin boundaries, are discussed in connection with
 expl. work on Si and Ge crystals. The nature of the
 boundaries was established by optical, x-ray, and electron-
 microscopy methods. Diffusion of minority carriers, re-
 combination rates, photovoltaic effects, and transient phe-
 nomena were investigated. The occurrence of $n-p-n$ junctions
 at some types of boundaries is assumed. The expl. data
 are discussed in terms of the d. of electronic states at the
 boundary. J. M. Haulg

AUTHOR: Sosnowski, Leonard

TITLE: Optical investigations of semiconductors

SOURCE: Postepy fizyki, v. 14, no. 6, 1963, 697-701

TOPIC TAGS: semiconductor absorption spectrum, semiconductor emission spectrum, semiconductor reflection spectrum, solid state band theory, solid state physics, lead sulfide, lead telluride, lead selenide, thallium sulfide, cadmium selenide, cadmium telluride, mercury telluride, silicon crystal, magnetooptics, photoconductivity, photoelectric effect, phonon field, photon, energy gap, exciton, boron single crystal

ABSTRACT: Since the 1940's, research in solid state physics at the Hozia School of Physics in Warsaw has centered on semiconductors, particularly on their electrical properties, in view of their technological value and importance in theoretical interpretations (the band theory represents an attempt at understanding the electrical properties of metals and semiconductors). Advances in experimental methods coupled with steady theoretical development account for the fact that optical methods have become the most accurate tool for the study of electron states in

Card 1/2

ACCESSION NR: AP4015998

solids. The investigation of absorption, reflection, and emission spectra, particularly in the presence of magnetic fields, provides a wealth of information that is inaccessible otherwise. The author gives a brief discussion of the band theory of solids as illustrated by the case of a semiconductor, relates it to spectral characteristics, and considers the effect of a magnetic field. He concludes with a list of semiconductor research problems investigated at the Hoza School since the 1940's; determination of the energy gap in PbS, PbSe, PbTe and Tl_2S , discovery of a new electron-hole recombination mechanism, present work on the photoconductivity of boron single crystals, recent emphasis on absorption and reflection spectra from semiconducting single crystals, interpretation of the nature of luminescence observed at p-n junctions in silicon. The latest line of research involves magnetooptics. Orig. art. has: 4 figures.

TITLE:

Isomeric Transition in Hg¹⁹⁹
19 19

PERIODICAL:

Acta Physica Polonica, 1959, Vol 18, Nr 6, pp 573-580 (Poland)

ABSTRACT:

It was the aim of the present paper to investigate the spectrum of internal conversion electrons for the isomeric transition in Hg¹⁹⁹ from the $i_{13/2}$ to the $f_{5/2}$ -level. This 370-kev transition was investigated under conditions, which permitted measurement of the ratio K/L and to estimate the E5 contribution. L.A.Sliv and A.M.Band had estimated the E5 admixture to 90%. Preparation of the Hg¹⁹⁹ source is briefly described and shown in figure 1. For measurement of the internal conversion electron spectra, a magnetic spectrometer with a thick lens was used. A G-M counter of the BAT-10 type with a mica window (1.3 mg/cm^2) served as detector. The spectrometer had a resolution of 3.3%, the counting background did not exceed 3 counts/min; the electron absorption in the window was negligibly small. Measuring results are shown in several

Card 1/2

Isomeric Transition in Hg^{199}

67357
POL/45-18-6-3/5

diagrams. They show good agreement with those calculated theoretically for M4 transition in consideration of the finite nuclear dimensions and nuclear field shielding by the electron shell. The authors obtained: $K:L(M+N) = 1:(0.57 \pm 0.09)::(0.12 \pm 0.07)$. The mixture ratio of M4 to E5 is shown in figure 7. The maximum E5 admixture is found not to exceed 11%, which is in agreement with what was found by Pound and Wertheim. The authors finally thank Professor A. Soltan for his advice during construction of the spectrometer and for his keen interest. There are 7 figures and 13 references, 4 of which are Soviet.

TITLE: Investigation of the Elastic Scattering of π^+ -Mesons With a Momentum of 6.0 Bev/c on Protons by Means of a Propane Bubble Chamber

PERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki, 1960
Vol. 36, No. 2, pp 426-431

Card 1/4

TEXT: For the purpose of making a contribution to the problem of proton structure, the authors investigated the scattering of negative α -mesons on protons having length $a = 0.8 \times 10^{-13}$ cm. The differential cross section was calculated for angles θ from 0 to 90° . The experimental data are shown in Fig. 1. The numerical distributions of π^- -mesons was determined from Fig. 2. The numerical distribution of π^+ -mesons was determined from Fig. 2. The numerical distribution of π^+ -mesons was determined from Fig. 2. The numerical distribution of π^+ -mesons was determined from Fig. 2.

Case 1/4

550 events was selected from all two-proton stars. The measured values of $\Delta\theta$ and $\Delta\phi$ for the 550 events are shown in Figs. 6 and 7. The events were processed by an electronic computer. The root-mean-square error in the angular determination was $\Delta\theta = 36^\circ$ and $\Delta\phi = 174^\circ$. The correlation for track curvature did not exceed 30° . The elastic two-pion events were identified by the criteria discussed here; coplanarity (Fig. 3), angular correlation (Fig. 4), small proton mass, among the 550 events investigated, 218 were regarded as being elastic. The so-called α -helix of these 218 events along the pion cascade, α , is shown at the bottom of the two-event diagram (4) on a scale of total length of 55 cm. The rest of the 218 events were regarded as inelastic. The distribution of these 311 events according to the elastic proton mass is shown in Fig. 6. It is seen that the elastic proton mass was on top in 100 it was 1640, in 19 it was 1670, in 30 it was 1710. An estimation of the percentage of quasielastic stars among events in the total number of elastic mass 656, the average position of the reaction investigated was found to be

Case 2/4

$\sigma_0(q^2 > 6^2) = 5.75_{-0.55}^{+0.55}$ mb, by taking into account a μ^2 sensitivity of $(5.2/3)^2$, with a total π^+ track length of 1.15×10^6 cm. q^2 is the scattering angle in the center-of-mass system. The total π^+ interaction cross section was estimated as being $(30.5)_{-2.5}^{+2.5}$ mb. The final part of the present paper offers an analysis of experimental results on the basis of the optical model, with the proton being regarded as a homogeneous, sharply bounded sphere with a radius $R = 1.40 \times 10^{-13}$ cm. The monochromatic absorption coefficient K is assumed to be $K = 0.71 \times 10^{10}$ cm $^{-1}$. Results are compared with those yielded by experiments (Table, Figs. 7-8). The authors finally thank Academician V. I. Veksler and L. V. Chivrikova for their discussions.

TITLE: Note on positron radiation from Pr^{140}

PERIODICAL: Acta Physica Polonica, v. 20, no. 12, 1961, 1021 - 1023

TEXT: In their letter to the editor the authors report on an investigation of the positron spectrum of Pr^{140} . Measurements were made with a long-lens spectrometer in which helical baffles were applied to separate positron and electron radiations. The Pr^{140} isotope was obtained from a neodymium fraction separated from a tantalum target by the chromatographic method. The target was irradiated with 660-Mev protons (synchrocyclotron of the Joint Institute of Nuclear Research at Dubna). Nd^{140} contained in the Nd fraction decays into Pr^{140} by electron capture. The Kurie plot is a straight line from 350 kev up to the maximum energy of 2366 ± 24 kev B. S. Dzhelepov (Zh. eksper. teor. fiz., 37, 857 (1959); Izv. Akad. Nauk SSSR Ser. fiz., 22, 153 (1958); Papers presented at the Second Conference on Neutron Deficient Isotopes of the Rare Earth Elements, Joint Inst. of

(2)
Sosnowski, W. Sur une interprétation géométrique des éléments complexes. Ann. Soc. Polon. Math. 24 (1951), no. 2, 35-48 (1954);

Von Staudt [Beiträge zur Geometrie der Lage, Heft I, Bauer and Raspe, Nürnberg, 1856] represented each pair of conjugate complex points on a line by the elliptic involution that has these for its invariant points, and distinguished the two by the apparently artificial device of associating

each with one of the senses along the line. The author uses, instead, a projectivity of period 3 and its inverse; there is then just one imaginary point for each such projectivity. He uses the symbol $\{xyz\}$ to denote the imaginary point represented by projectivity $xyz \rightarrow yzx$, where x, y, z are three real points on the line. Restricting consideration to two dimensions, he gives the dual representation for an imaginary line, and shows that the line joining $\{xyz\}$ and $\{xuv\}$ is $tx, ty, tz (=) tx, tu, tv$, where t is the point of intersection of the two real lines yu and zv . The construction for the intersections of a conic with an exterior line is given in an affine form, for convenience. Making a brief excursion into Euclidean geometry, he remarks that the isotropic lines through any point are represented by the rotations through $\pm 120^\circ$. He shows also that projectivities of periods 4 or 6 can be used just as well as those of period 3; in fact, the construction for the intersections of a line and a conic is particularly simple in the case of period 4.

TITLE: Electromechanic ²⁵signal converter. Class 62, No. 186296

SOURCE: Izobreteniya, promyshlennyye obrastay, tovarnyye znaki, no. 18, 1966,
159

TOPIC TAGS: electromechanic converter, electromechanic signal converter,
electromagnetic device, servomechanism, electrohydraulic servomechanism,
electropneumatic servomechanism

ABSTRACT: The proposed electromechanical signal converter is intended
primarily for electrical hydraulic and pneumatic servomechanisms. It contains a
housing, a permanent-magnet electromagnetic device, pole pieces with adjustment
screws, a coil and a portable system unit which includes an elastic element, an
armature terminal, an operating slide element, and a magnetically permeable
bushing. To improve operational reliability, ensure the possibility of operating in

ACC NR: AP6033520

corrosive liquids, and improve the dynamic properties of the converter, the operating slide element is hermetically separated from the electromagnetic device and by an air gap from the magnetically permeable bushing. The slide element and the armature are a single unit, and the sealing element also serves as the elastic element of the portable system. The adjusting screws are fixed to the poles of the permanent magnet so as to make it possible to use the converter for servo-mechanising with various output characteristics and in order to ensure the smooth tuning of converter characteristics [Translation]

attached to the flaps (see Fig. 1). For greater reliability the shaft linking the carriage to the flap's longeron is graduated, with a cam in its center and a seat in its butt, which is intended for a wrench for turning the shaft. The shaft has a hole for a set screw which can be secured when the carriage and track are butted during the superposition of their longitudinal surfaces. Orig. art. has: 1 figure. [KT]

Full Title: A HANDBOOK FOR ELECTROTECHNICAL PERSONNEL IN FERROUS METALLURGICAL INDUSTRIES

Editors: Shalyapin, M.G.
Levitanskiy, B.A.

Appraiser: None.

Text Data

Coverage: A detailed handbook containing technical data on specifications, standards, design and operation of various types of electrical equipment in ferrous metallurgical industries: electric power supply plants and their distributing systems, transforming stations and transmission lines (high and low tension), blast furnace works, rolling mill plants, open-hearth plants, mines, electrical steel smelting and ferroalloy furnaces, sintering plants, coke plants, and electrical transport. Tables and diagrams. Subject index.

Purpose: A handbook for electrotechnical personnel, engineering technicians, machine operators, and planning personnel of metallurgical industries.

Facilities: None.

No. of Russian references: References listed at end of each chapter.

Available: Library of Congress.

AUTHOR: Sosunov, N. I.

TITLE: Tank for ¹⁴ultrasonic cleaning of machine parts in aggressive fluids

SOURCE: Byul. tekhniko-ekonomicheskoy informatsii, no. 4, 1963, 29-30

TOPIC TAGS: ultrasonic waves, aggressive fluids, cleaning of machine parts, galvanizing, UZVT-1

ABSTRACT: Generally in ultrasonic cleaning tanks waves are transmitted from the emitter to the working fluid through an intermediate water layer. A new type of tank invented by A. F. Zakatov increases the ultrasonic pressure in the working fluid by subjecting the intermediate water layer to extra pressure. Diagrams of two types of tank are shown. Increased ultrasonic pressure speeds time consuming cleaning processes and intensifies galvanizing processes. Machine parts of complex configuration can be cleared from grease and impurities in 4 to 6 min. Production of types UZVT-1, UZVT-2, and UZVT-3 for ultrasonic cleaning of machine parts in aggressive fluids is planned for 1963. Orig. art. has: 1 figure.

TITLE: LF Amplifier

PERIODICAL: Radio, 1959, Nr 6, p 51 (USSR)

ABSTRACT: A simple LF amplifier is described without transformer coupling having an output of 100 milliwatts. The amplifier was shown at the 15th All-Union Exhibition of Radio Amateur Designs in Riga. A n-p-n transistor of type P101A and a so-called compound transistor, consisting of one P6A and one P2B transistor are used. The circuit diagram is shown in Figure 1. A dynamic loudspeaker of type "1GD-9" is used. The power is required by three elements of FBS-0.25 batteries. There is 1 circuit diagram.

TITLE: The Effects of Brucellosis Vaccination on the Course of the Infectious Process in Guinea Pigs Infected With Brucella Melitensis

PERIODICAL: Zhurnal mikrobiologii, epidemiologii i immunobiologii, 1960, No 4, pp 58 --60 (USSR)

ABSTRACT: Experiments were performed to determine the effects of brucellosis vaccination on persons infected with brucellosis by extrapolating the results of vaccination of guinea pigs, experimentally infected with Br. melitensis. Vaccination of the infected animals 2 - 3 months after infection with Br. melitensis did not provoke chronic infection. No increase in the multiplication or spread of brucella could be noted in the animal's organs. The vaccinal strain probably reacted by stimulating the body's defensive mechanism, clearing the body more rapidly of Br. melitensis. It thus reacted similarly to vaccine therapy with killed brucella. It was difficult to achieve superinfection in animals infected with Br. melitensis by the administration of a vaccinal culture of low virulence; the vaccinal strain either refused to take or

TITLE: The Comparative Characteristics of Three Vaccinal Strains of Brucella (19-BA, 19 and M) in Experimental Subcutaneous and Skin Administration ⁶

PERIODICAL: Zhurnal mikrobiologii, epidemiologii i immunobiologii, 1960, No. 6, pp. 12 - 16

TEXT: At the proposal of the Ministerstvo zdavookhraneniya SSSR (Ministry of Health of the USSR), the authors studied the characteristics of the three vaccinal strains of *Brucellus abortus* (19-BA, 19 and M) used in the USSR for immunizing people against brucellosis. Guinea pigs were immunized subcutaneously or dermally with the strains, killed off after 1, 5, 15, 30, 45, 60, 90 or 180 days and studied for pathological lesions, the isolation of brucellae from various organs and for their immune response. Strain M had greater residual virulence than strains 19-BA and 19, caused more extensive pathological lesions and led to a greater spread of brucella through the organs and tissues. No essential difference was noted in the residual virulence of strains 19-BA and 19, since both caused identical lesions in the internal organs, affected the same tissues and caused the same immune

Card 1/2

S/016/60/000/06/03/051

The Comparative Characteristics of Three Vaccinal Strains of Brucella (19-BA, 19 and M) in Experimental Subcutaneous and Skin Administration

response. The immune response from the M strain lasted longer and was more intense than that caused by strains 19-BA and 19. All three strains were highly immunogenic. Dermal vaccination caused slightly less lesions and the same depth of immunity as subcutaneous immunization. Strain 19 is therefore to be recommended for vaccination purposes. If strain M is used, care must be taken in selecting the correct dosage in view of its greater residual virulence. There are 2 tables and 6 Soviet references.

SOSUNOVA, I. N.

✓ 2886. The determination of lead in water. I. N. Sosunova. *Inform.-Metod. Materialy. Gos. Nauch. Issledovatel. Sanit. Inst.*, 1954, (5), 32-35; *Ref. Zhur., Khim.*, 1955, (17), Abstr. No. 37,516.—Pour the sample (100 ml) into a cylinder with a ground glass stopper, add 4 ml of 25 per cent. NH_4Cl soln., 1 ml of 1 per cent. CaCl_2 soln., 10 ml of 25 per cent. aq. NH_3 soln., and 1 ml of 1 per cent. Na_2CO_3 soln. Insert the stopper and shake, then allow to stand for 24 hr. At the same time treat 100 ml of twice-distilled H_2O similarly for use as a blank. Coloured waters are boiled before pptn., adding 5 ml of 5 per cent. $(\text{NH}_4)_2\text{S}_2\text{O}_8$ soln. and 50 ml of distilled H_2O to 100 ml of the sample, and evaporating down to 100 ml. The following day, separate the ppt. from the clear liquid (used for determination of Cu) and wash with 3 ml of aq. NH_3 soln. (5 ml of 25 per cent. aq. NH_3 made up to 100 ml), remove the wash liquor and centrifuge out the ppt. Pour off the liquid, add 2 ml of 2 per cent. HCl to the ppt., transfer to the cylinder in which pptn. took place, washing out the centrifuge tube twice. The ppt. dissolves completely in the HCl . Transfer the soln. to a 10-ml colorimeter tube and make up to the mark. Then add 1 ml of 50 per cent. KNa tartrate soln., 1 ml of 30 per cent. NaOH soln., and 0.1 ml of 15 per cent. $\text{Na}_2\text{S}_2\text{O}_4$ soln. (aq. or in glycerol), and mix. A yellow-brown colloidal suspension of PbS is formed, which is compared with permanent painted standards or with freshly prepared liquid standards containing 0 to 300 μg of $\text{Pb}(\text{NO}_3)_2$ per litre. The accuracy of the method is within ± 20 per cent. C. D. KOPKIN
